Renewable electricity production, from sources such as wind power and solar power, is variable which results in reduced capacity factor and require either energy storage of capacity equal to its total output, or base load power sources from non intermittent sources like hydropower, fossil fuels or nuclear power. Since renewable energy sources power density per land area is at best three orders of magnitude smaller than fossil or nuclear power, rene-

The Rosenfeld is based on savings realized by not building a 500 MW, 33% efficient, coal-fired power plant, operating with a CF of 70%, sending power through a T&D system with 7% losses. One Rosenfeld equals an energy savings of 3 billion kWh/yr and an annual carbon reduction of 3 million metric tons of CO<sub>2</sub>.
